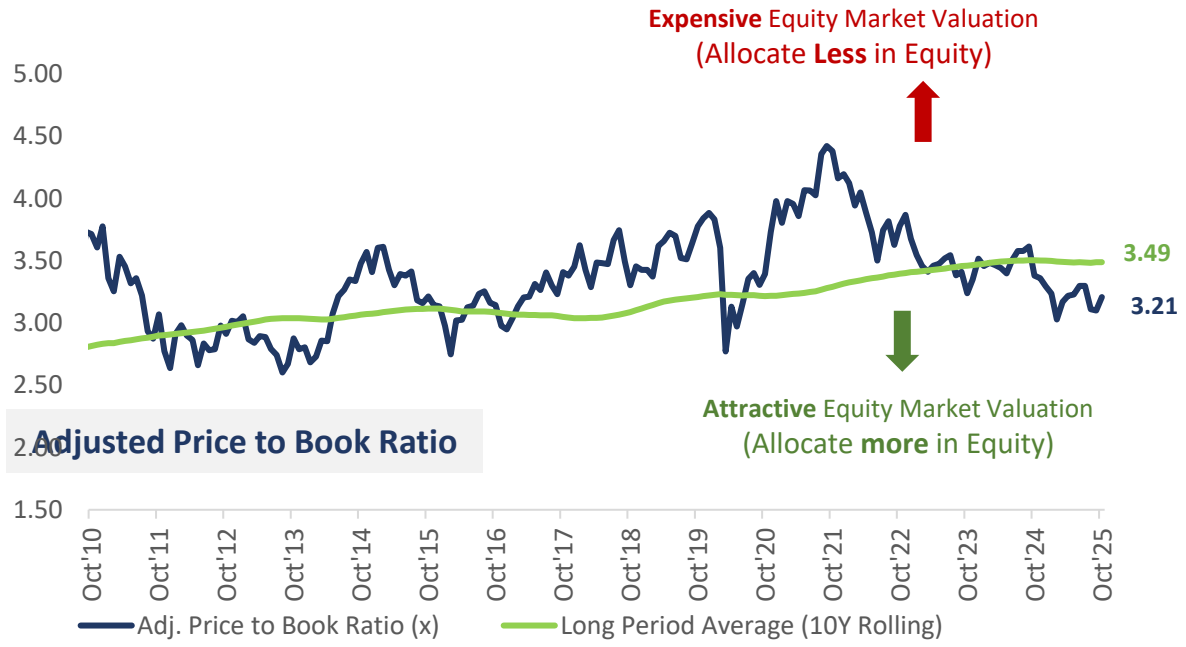
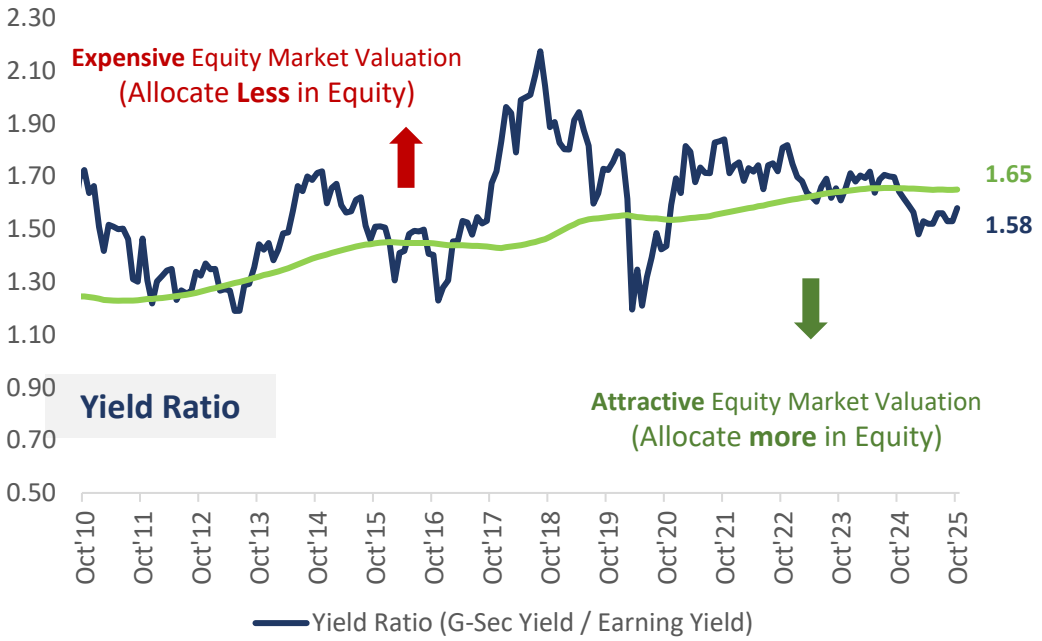
Domestic Equity Valuation: Key Parameters

Historical Trend v/s Long Period Average, as on 31st October 2025





- A **very high** Ratio of G-Sec Yield/ Earning yield of Index and Adjusted P/BV **compared to long term average**, indicates higher model value (Expensive Equity Market Valuation), may result in **lower equity allocation**
- A **very low** Ratio of G-Sec Yield/ Earning yield of Index and Adjusted P/BV **compared to long term average**, indicates lower model value (Attractive Equity Market Valuation), may result in **higher equity allocation**

Data Source: MOSL, Bloomberg and Internal Research. The parameters mentioned above are indicative only. The AMC may add other parameters and change the weightages based on the prevailing market conditions. The internal proprietary model may use parameters like Adjusted Price to Book Value of Equity market indices (with an overlay of ROE), Ratio of G-Sec Yield to Earning Yield of Equity market indices, VIX and Equity and Debt Momentum while deciding the Asset Allocation levels of the portfolio (internal model). This internal proprietary model may go through periodic revision (as and when required), resulting in addition or deletion of parameters and the weightages assigned to them.

Weights of Multi Asset Portfolio^

Asset Class	Represented by	Weight
Domestic Equity	BSE Sensex TRI	25%
Debt	CRISIL Short Term Bond Index	45%
Gold	MCX Gold (INR)	25%
US Equity	S&P 500 TRI (INR)	5%

^The above table is only to understand the concept of Multi Asset Allocation. Depending on what weight one assigns to different asset classes, the results can vary accordingly.

It is interesting to note from above table that for a Multi-Asset Portfolio, Gold has provided some downside protection in many of the years when Domestic Equity has delivered negative returns and vice versa.
